

Information Management System

Objective

The Engineering Directorate has developed unique software applications programs with the capability to manage the information flow in a project or program. The system is known as the "Online Project Management System" and is currently being utilized by several projects at the Center. Additional capabilities are being developed to enhance the existing system.

Why Needed

In today's world, the transfer of information to all parties involved in a project can be accomplished by electronic means. Access to the most current information is critical to both the technical and cost management parts of a program. Reduced need for personal interaction and greater productivity are offered.
